MPCC - Model Predictive Contouring Control

MPCC is a control scheme based on minimisation of a cost function which reflects the trade-off between the competing objectives of accuracy and traversal time.

Figure 1.Contouring error e^c (left) and lag error e^l (right) with linear approximations \hat{e}^c and \hat{e}^l . Retrieved from [1]

$$e^l(X, Y, \theta_A) \triangleq |\theta_A - \theta_P|$$

$$e^c(X, Y, \theta_P) \triangleq \sin(\phi(\theta_P))(X - X^{ref}(\theta_P)) - \cos(\phi(\theta_P))(Y - Y^{ref}(\theta_P)) \quad \hat{e}^c(X, Y, \theta_A) \triangleq \sin(\phi(\theta_A))(X - X^{ref}(\theta_A)) - \cos(\phi(\theta_A))(Y - Y^{ref}(\theta_A))$$

$$\hat{e}^l(X, Y, \theta_A) \triangleq -\cos(\phi(\theta_A))(X - X^{ref}(\theta_A)) - \sin(\phi(\theta_A))(Y - Y^{ref}(\theta_A))$$

Original MPCC Formulation

$$\min_{x,u} \sum_{k=1}^N \|\hat{e}_k^c(X_k, Y_k)\|_{Q_1}^2 + \|\hat{e}_k^l(X_k, Y_k)\|_{Q_2}^2 - q\theta_k + \|\Delta T_k\|_{R_1}^2 + \|\Delta\delta_k\|_{R_2}^2 + \|\Delta\theta_k\|_{R_3}^2$$

subject to

$$x(0) = x_0$$

$$x_{k+1} = f(x_k, u_k), \forall k = 0, \dots, N-1$$

$$\theta_{k+1} = \theta_k + \Delta\theta_k, \forall k = 0, \dots, N-1$$

$$x_{min} \leq x_k \leq x_{max}, \forall k = 1, \dots, N$$

$$u_{min} \leq u_k \leq u_{max}, \forall k = 0, \dots, N$$

$$(X_k - X_k^{ref})^2 + (Y_k - Y_k^{ref})^2 \leq r^2, \forall k = 1, \dots, N$$

$$\hat{e}^c(X, Y) \triangleq \sin(\phi^{ref})(X - X^{ref} - \nabla X^{ref}(\theta - \hat{\theta})) - \cos(\phi^{ref})(Y - Y^{ref} - \nabla Y^{ref}(\theta - \hat{\theta}))$$

$$\hat{e}^l(X, Y) \triangleq -\cos(\phi^{ref})(X - X^{ref} - \nabla X^{ref}(\theta - \hat{\theta})) - \sin(\phi^{ref})(Y - Y^{ref} - \nabla Y^{ref}(\theta - \hat{\theta}))$$

$$\text{State Vector } x: [X, Y, \psi, V_X, V_Y, \omega, T, \delta, \theta]^T \quad \{Q_1, Q_2, q, R_1, R_2, R_3\} \in \mathbb{R}$$

$$\text{Control Vector } u: [\Delta T, \Delta\delta, \Delta\theta]^T$$

Reference Trajectory as Splines Why?

- **Use Splines to parameterize the path.**
 - Change the spline parameters to change the shape of the path.
 - Easier to sample discrete coordinates to represent a path.
- **Splines are basically piecewise polynomials.**
 - Break the curve into multiple segments, each segment is a polynomial interpolated to form a continuous curve.
- **Cubic splines** are the most common lowest order piecewise polynomials.
 - The continuity at the control points of piecewise cubic splines is also defined.

Figure 2. Spline representing a curve in green, blue dots are controls points where polynomials are interpolated

Reference path representation with Cubic Splines

Center track is parameterized by θ where, $\theta \in [0, L]$
L: Length of the track

$$X^{ref}(\theta_A) = a_x + b_x\theta_A + c_x\theta_A^2 + d_x\theta_A^3$$
$$Y^{ref}(\theta_A) = a_y + b_y\theta_A + c_y\theta_A^2 + d_y\theta_A^3$$

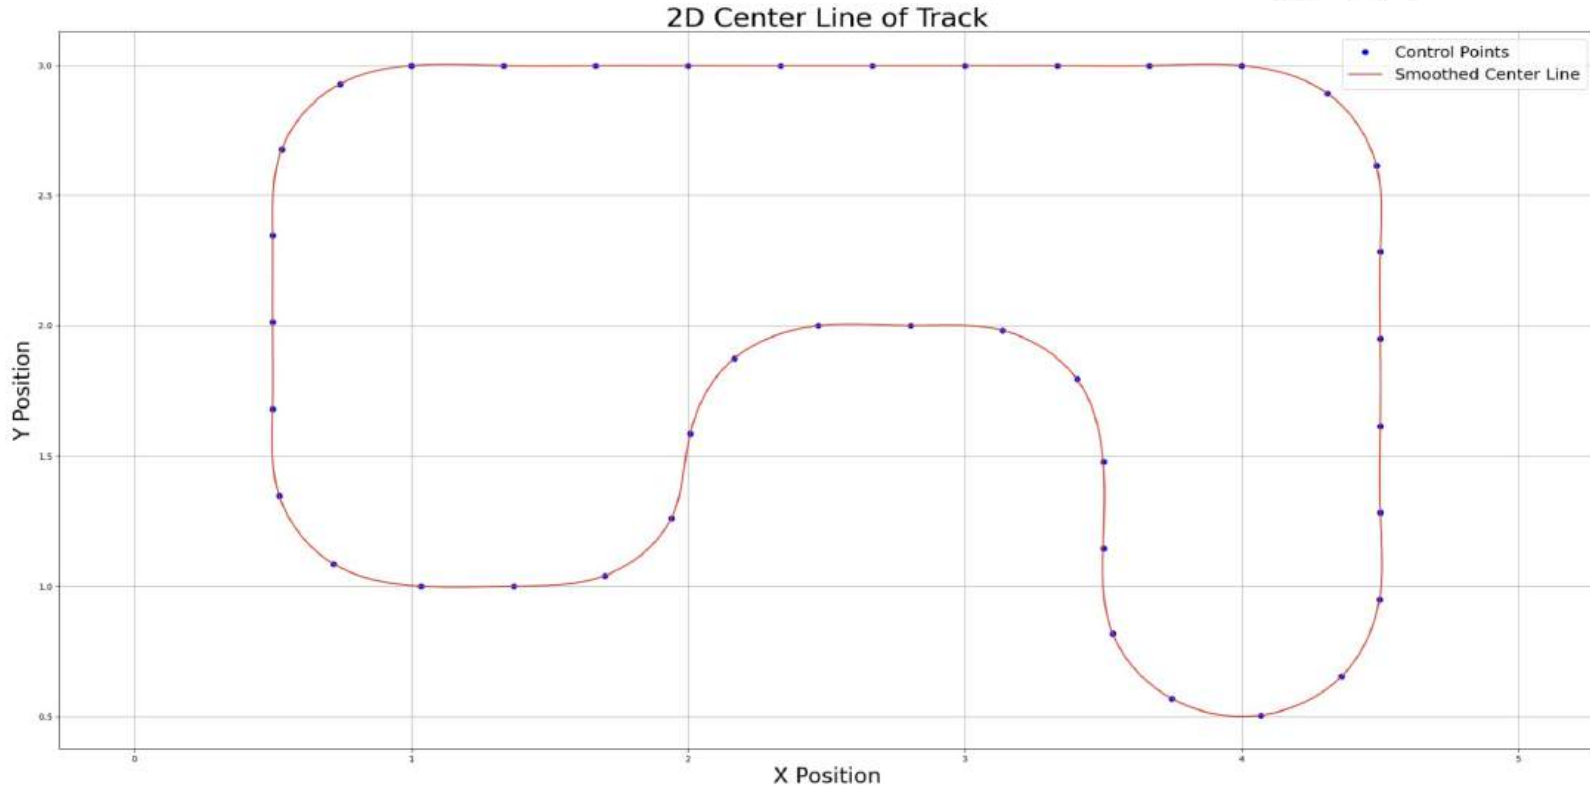

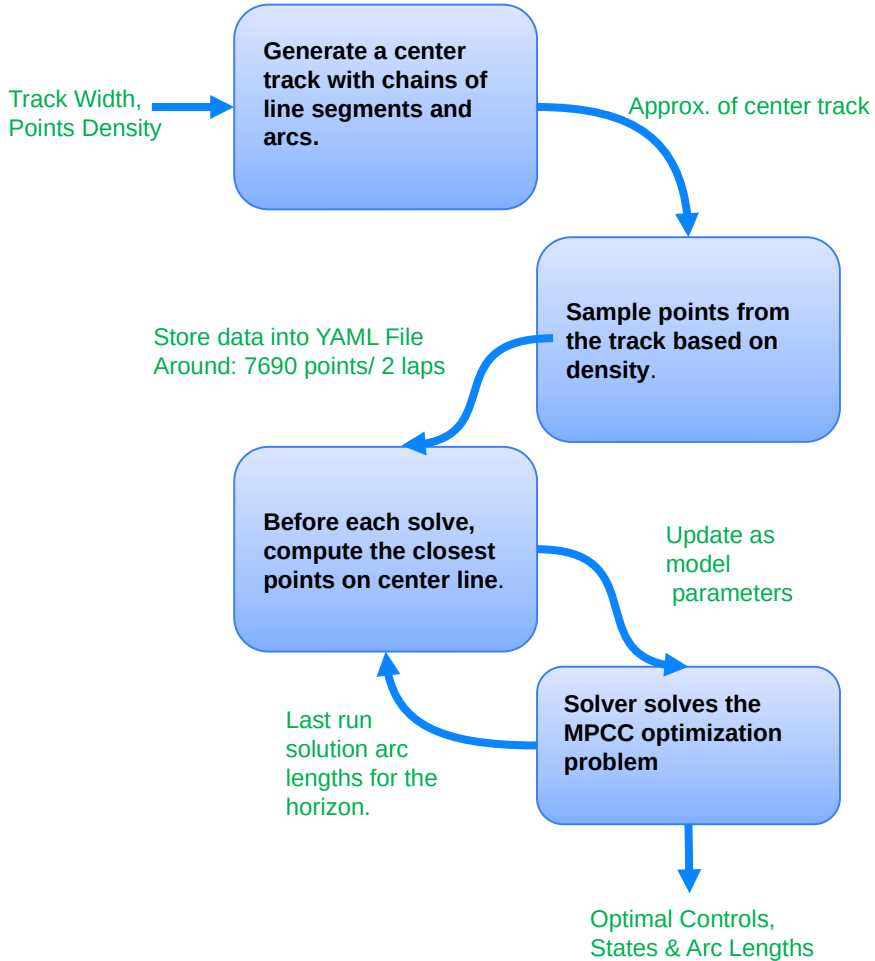

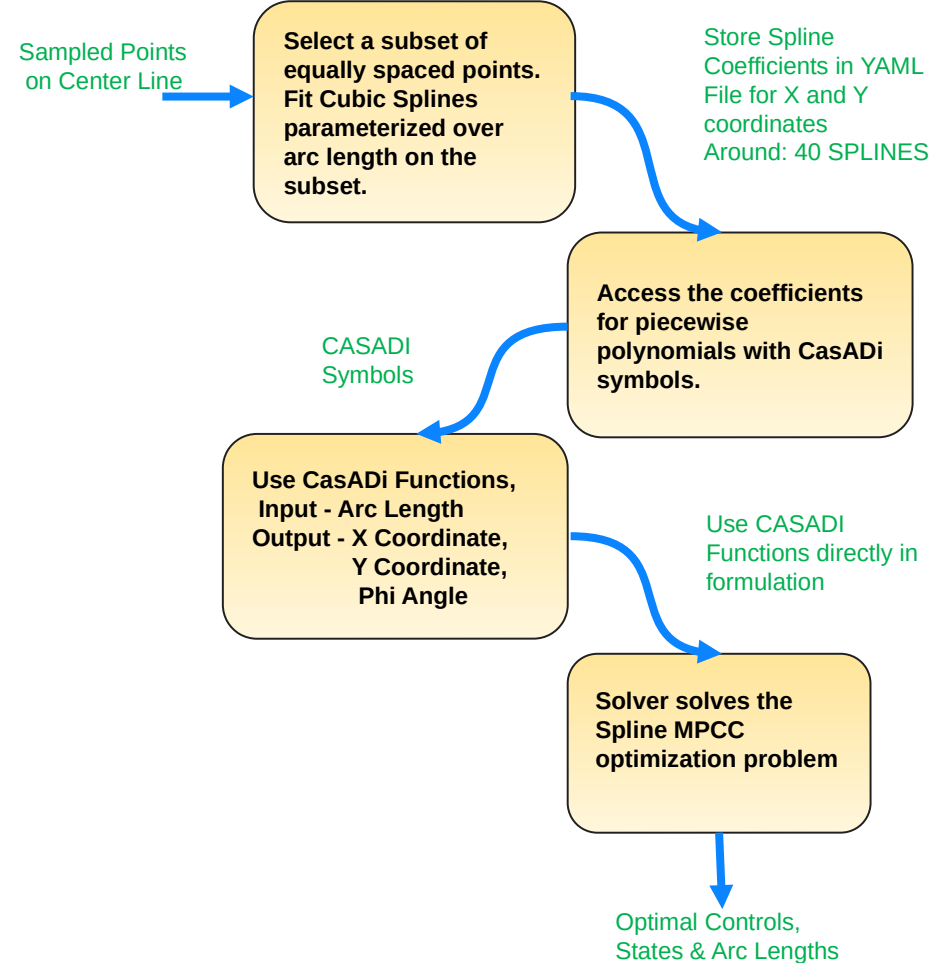

Figure 3. Result of the cubic spline interpolator fitting across the sampled control points

ORIGINAL MPCC CONTROLLER

SPLINE BASED MPCC CONTROLLER

MPCC formulation with Splines

$$\min_{x,u} \sum_{k=1}^{N-1} \|\hat{e}_k^l(X_k, Y_k, \theta_{A,k})\|_{Q_2}^2 - q\theta_{A,k} + \|\Delta T_k\|_{R1}^2 + \|\Delta \delta_k\|_{R2}^2 - q_N\theta_{A,N}$$

subject to

$$x(0) = x_0$$

$$x_{k+1} = f(x_k, u_k), \forall k = 0, \dots, N-1$$

$$\theta_{A,k+1} = \theta_{A,k} + \Delta\theta_k, \forall k = 0, \dots, N-1$$

$$x_{min} \leq x_k \leq x_{max}, \forall k = 1, \dots, N$$

$$u_{min} \leq u_k \leq u_{max}, \forall k = 0, \dots, N$$

$$(X_k - X_k^{ref}(\theta_{A,k}))^2 + (Y_k - Y_k^{ref}(\theta_{A,k}))^2 \leq r^2, \forall k = 1, \dots, N$$

where,

$$\hat{e}^c(X, Y, \theta_A) \triangleq \sin(\phi^{ref}(\theta_A))(X - X^{ref}(\theta_A)) - \cos(\phi^{ref}(\theta_A))(Y - Y^{ref}(\theta_A))$$

$$\hat{e}^l(X, Y, \theta_A) \triangleq -\cos(\phi^{ref}(\theta_A))(X - X^{ref}(\theta_A)) - \sin(\phi^{ref}(\theta_A))(Y - Y^{ref}(\theta_A))$$

$$X^{ref}(\theta_A) = a_x + b_x\theta_A + c_x\theta_A^2 + d_x\theta_A^3$$

$$Y^{ref}(\theta_A) = a_y + b_y\theta_A + c_y\theta_A^2 + d_y\theta_A^3$$

$$\phi^{ref}(\theta_A) = \frac{\partial Y^{ref}(\theta_A)}{\partial X^{ref}(\theta_A)}$$

$$0 \leq \theta_A \leq L$$

Figure 4. Retrieved from [1]

$$\theta_A \approx \theta_P$$

$$\hat{e}_l(X_k, Y_k, \theta_{A,k}) \approx 0$$

$$\hat{e}_c(X_k, Y_k, \theta_{A,k}) \approx \text{track constraints}$$

➤ **Original MPCC formulation:**

$$\min_{x,u} \sum_{k=1}^N \|\hat{e}_k^c(X_k, Y_k)\|_{Q_1}^2 + \|\hat{e}_k^l(X_k, Y_k)\|_{Q_2}^2 - q\theta_k + \|\Delta T_k\|_{R_1}^2 + \|\Delta \delta_k\|_{R_2}^2 + \|\Delta \theta_k\|_{R_3}^2$$

➤ **MPCC formulation with spline:**

$$\min_{x,u} \sum_{k=1}^{N-1} \|\hat{e}_k^l(X_k, Y_k, \theta_{A,k})\|_{Q_2}^2 - q\theta_{A,k} + \|\Delta T_k\|_{R_1}^2 + \|\Delta \delta_k\|_{R_2}^2 - q_N \theta_{A,N}$$

subject to

$$x(0) = x_0$$

$$x_{k+1} = f(x_k, u_k), \forall k = 0, \dots, N-1$$

$$\theta_{A,k+1} = \theta_{A,k} + \Delta \theta_k, \forall k = 0, \dots, N-1$$

$$x_{min} \leq x_k \leq x_{max}, \forall k = 1, \dots, N$$

$$u_{min} \leq u_k \leq u_{max}, \forall k = 0, \dots, N$$

$$(X_k - X_k^{ref}(\theta_{A,k}))^2 + (Y_k - Y_k^{ref}(\theta_{A,k}))^2 \leq r^2, \forall k = 1, \dots, N$$

Figure 5. Lag error for Spline MPCC and original MPCC

- The lag error values for Spline MPCC is comparatively very small.
- Could be further reduced by increasing the number of piecewise cubic splines for center track representation.

MPCC with Spline

Performance of the MPCC Formulations

| Solver Frequency (Hz) (1 / Sampling Time (Ts)) | Horizon Length (N) | Time taken by solver for single solve (mSec) | | Observed results with Spline MPCC Formulation |
|---|--------------------------|---|----------------------------|---|
| | | Original MPCC formulation | Spline MPCC formulation | |
| 25 | 30 | 3.181 | QP fails | QP fails to generate a solution.. |
| | 40 | 3.498 | | |
| | 45 | 3.626 | | |
| 30 | 30 | 3.501 | 17.756 | Optimal Solution is achieved. At continuous curved section the velocity tends to be slower. |
| | 40 | 3.726 | 19.798 | |
| | 45 | 3.987 | 22.224 | |
| | 30 | 3.622 | 10.405 | At straight section there is oscillatory |

Lap Times of MPCC Formulations

Frequency of solver: 30 Hz

Horizon Length: 40

| MPCC Formulation | Lap time (seconds) | Fastest Lap Time (seconds) |
|------------------|--------------------|----------------------------|
| Original MPCC | 4.77 - 4.85 | 4.77 - 4.80 |
| Spline MPCC | 4.62 - 5.01 | 4.62 - 4.71 |

Observations

- The controller has more freedom to move across the whole of the track width.
- The optimal **trajectory is fairly smoother** around steep curves.
- Having removed the contouring cost and cost on virtual velocity, there are **lesser weights to be tuned**.
- The lookahead is observed to be larger than original formulation.
- **Warm starting is not really required** for the Spline MPCC formulation.
- The lap times of both the formulations is comparable, but the Spline MPCC is producing **better fastest lap times**.

Possible Improvements

- Initial Guess could have an impact on the performance of the QP Solver.
- Could try using some globalization technique such as line search algorithm to vary the step size.
- Increasing the number of piecewise splines, would give better approximation for the center track.
- Update in model and track parameters would result in better results.
